

Overview

Unique Players

In GOALS, we have the ambition to make every single player in the game unique, since we believe that variety is a crucial part of keeping the game exciting. However, we also realize the appeal of being able to relate to real-world players when playing a football game. Therefore, we will implement a DNA system to enable the best of both worlds - fully unique players with real-world connections. Through the DNA system, players can, if lucky, inherit specific attributes from real-life footballers. Read more about player generation here: [Generating Players](#)

Aging system

If a user can keep all players forever and just work on developing their team each day, eventually they are going to build a super team and would have a low incentive to play the game to keep improving their team. The best time of the year in other football games is usually early in the yearly cycle when there is still loads of room for improvement in teams. Not every opponent has a super team, and the motivation to improve your own team is very high. We want to maintain this feeling over time, and to do so, an aging system will be implemented that strives to keep the game's balance and longevity.

All players in GOALS will enter the game at the age of 18 and will age one year every two real-life weeks. Players retire between 32-41 years old, and the owner will be given a one-year's notice (two real-life weeks) before a player retires. We believe that the aging system, aside from securing the game's longevity, forces users to build new teams and go through different cycles which is very similar to what every real football club has to go through. You might have to play with some weak spots in your team during certain periods, which will put both your skills and team management qualities up to the test.

Retired players

To counteract that any efforts go to waste and that players lose all their value when they retire, all retired players are stored in the club. Retired players can be used forever, but there is one caveat: only three retired players can be used in a squad for the official game modes. Special tournaments with customized rules might allow more or fewer retired players in a squad. The reason why we choose to implement a limitation for the number of retired players allowed in the official game modes is twofold:

1. Keeping a constant demand for new players and maintaining the game's longevity. If we would allow squads full of retired players, the demand for new players would be severely compromised and would lessen every year. By requiring eight active players for all squads, we ensure that new players entering the game are always relevant.
2. Allowing the best players in the game to maintain their value after retirement. If no retired players were allowed to be used, the problem would instead be the opposite, where all players would lose their value over time when they close in on retirement. With the current structure, desirable players can be used forever and will therefore maintain their value. For less desirable retired players, there will be specific player exchange tasks (PETs) with retired player requirements to ensure a base value for all retired players. We anticipate that a minority of all players entering the game will reach their retirement since many will be submitted into desirable PETs during their active careers. Read more about PETs here: [📖 Player Exchange Tasks \(PETs\)](#)

We believe that this structure provides utility both to active players, as well as retired players, whilst still maintaining the ability to grind the main game modes without having to face super teams full of retired players. Even if only three retired players can be used in official game modes, there is no limit to how many retired players a user can store in their club.
