Player Attributes

Attributes are the different skill sets every player in GOALS has. Each attribute has several underlying stats, often referred to as “sub-stats”. The value of each sub-stat determines how well a player will perform in-game. The value of a sub-stat ranges from 1-99, and the performance increase for stats is usually linear.

Below is a description of each sub-stat in GOALS, and how it affects the player’s performance during gameplay

Note: All stats and their impact on gameplay are subject to change. Furthermore, stats balancing is done regularly, meaning the importance of a certain sub-stat can vary over time. Feedback on stats logic and balancing is much appreciated!

Green marked sub-stats = Currently active in-game

Pace

Attribute	Description	Controls
Acceleration	The acceleration stat determines how fast a player can increase their speed.	Left stick

	The acceleration rate gradually decreases as the player is approaching top speed.	RT / R2
Speed	The sprint speed stat determines the maximum speed a player can reach when sprinting.	RT / R2

Shooting

Attribute	Description	Controls
Attacking IQ	The attacking IQ stat determines how well AI-controlled players positions themselves during attacking scenarios as well as how much speed they use when moving in attacking spaces	AI Controlled.
Finishing	The finishing stat determines a player's accuracy when shooting from a short range. Shooting accuracy is also affected by % of power charged on the power bar, where a higher charge gives lower accuracy. Medium-range accuracy is affected by both the finishing and long shot stats, where the closer the distance,	Normal: B / O Finesse Shot: RB + B / R1 + O Driven Shot: B + B / O + O Driven Finesse Shot: RB + B + B / R1 + O + O

	the higher the weight of the finishing stat.	
Shot Power	The shot power stat determines the amount of power a player can shoot with. Shooting accuracy is not negatively affected by a higher shot power stat, it is only affected by how much the shot power bar is charged.	Normal: B / O Finesse Shot: $RB + B / R1 + O$ Driven Shot: $B + B / O + O$ Driven Finesse Shot: $RB + B + B / R1 + O + O$
Long Shots	The long shot stat determines a player's accuracy when shooting from a long range. Shooting accuracy is also affected by % of power charged on the power bar. Medium-range accuracy is affected by both the finishing and long shot stats, where the further the distance, the higher the weight of the long shot stat.	Normal: B / O Finesse Shot: $RB + B / R1 + O$ Driven Shot: $B + B / O + O$ Driven Finesse Shot: $RB + B + B / R1 + O + O$
Penalty Accuracy	The penalty accuracy stat affects the pulse rate of the timing mechanic. A higher penalty accuracy stat results in a slower	Shoot: B / O

	pulse rate which makes it easier to time.	
Weak Foot	The weak foot stat determines how well a player can perform shots and passes with their weak foot. The weak foot stat acts as a multiplier on top of a player's regular shooting/passing stats when performing an action with the weak foot.	All shooting and passing inputs

Passing

Attribute	Description	Controls
Ground Pass	The ground pass stat determines the speed at which a player can perform ground passes relative to the distance to the receiver. The higher the stat is, the more speed the pass is played with.	Regular: A / X Driven Pass: RB + A / R1 + X
Lofted Pass	The lofted pass stat determines the accuracy of a lofted pass. The lofted pass stat also affects the vertical angle a pass is played at, where players with a high stat can hit lower and hence quicker lofted passes.	X / □

Through Pass	The through pass stat determines how far ahead a player can play a through pass depending on the positioning of the opponents.	Regular: Y / Δ Lofted: $LB + Y / L1 + \Delta$
Crossing	The crossing stat determines a player's accuracy and speed when crossing the ball.	Regular: $X / \square$ Low: $X + X / \square + \square$ High: $LB + X / L1 + \square$
Curve	The curve stat determines how much curve a player can get on finesse shots, low finesse shots, and crosses. The higher the player's stat is, the more they can curve the ball when shooting and crossing.	Curved shot: $RB + B / R1 + O$ Low curved shot: $RB + B + B / R1 + O + O$
Free Kick Accuracy	The free kick accuracy stat will determine the accuracy of a shot when performing a free kick.	Shoot: B / O Cross: $X / \square$

Dribbling

Attribute	Description	Controls
Sprint Dribbling	The sprint dribbling stat determines the speed penalty when sprinting with the ball. It also affects the ability to perform	Left Stick + RT

	touches in the contextual sprint dribbling state when an opponent is close, where players with a high sprint dribbling stat can perform shorter touches.	
Close Dribbling	The close dribbling stat determines the speed penalty when jogging with the ball, and the cooldown between touches. High stats have a lower speed penalty and a reduced cooldown between touches.	Left Stick
First Touch	The first touch stat determines the probability of different touch cooldowns after taking a first touch. Players with a high first touch stat are more likely to get a lower cooldown (and hence touch force) after taking a first touch. The first-touch cooldown is also influenced by the speed, height, and angle of the incoming ball.	Left stick
Agility	The agility stat determines the	Left Stick

	deceleration rate of a player when making harsh directional changes. The higher the agility stat is, the quicker a player will decelerate.	
Balance	The balance stat acts as a multiplier on top of weight to determine how much force a player can withstand when they are in possession of the ball. Players with a high balance stat will have a high balance multiplier and hence be able to withstand more force relative to their weight without getting pushed off the ball.	Automatic
Skills	The skills stat determines at which speed and accuracy a player can perform skill moves. The higher the player's stat is, the faster and more precise the execution is.	Right stick (mainly)

Defending

Attribute	Description	Controls
-----------	-------------	----------

Defensive IQ	Determines how well a player position themselves defensively, how quickly they track a run and how well they mark players.	AI Controlled
Stand Tackle	The standing tackle stat determines the width of the tackling assistance zone. The higher the stat is, the wider the assistance zone is.	B / O
Slide Tackle	The sliding tackle stat determines the width of the assistance zone, the reach of a sliding tackle and the speed at which a slide tackle is performed.	X / ☐
Jockeying	The jockeying stat determines the maximum speed of a player when in a jockey state. The higher the stat is, the higher the maximum speed.	LT/L2 + Left Stick
Interceptions	The interceptions stat currently determines the lunge range at which a player can stretch to intercept passes. Soon we will also tie the interception	Automatic

	stat to a reaction time which will affect how quickly players react to be able to intercept passes.	
Blocking	The blocking stat determines a player's blocking radius when attempting to block a shot. The higher the stat is, the bigger the radius is. This stat only comes into effect if the player is user-controlled. AI-controlled players will have a smaller blocking radius.	Automatic, but bigger radius for a user-controlled player

Physicality

Attribute	Description	Controls
Jumping	The jumping stat determines how high a player can jump. The higher the stat is, the higher the player can jump. The total jumping reach of a player is determined by height + jumping stat.	Automatic
Strength	The strength stat, together with weight, affects how much force	Automatic

	a player can apply to another player.	
Stamina	The stamina stat determines how fast a player's stamina gets depleted. The higher the stat is, the slower the stamina depletion rate. In the future, stamina depletion will also be affected by team tactics and the player role assigned to the player.	Spend: RT/R2 Recover: left stick / no input
Aggression	The aggression stat determines how close to an opponent an AI-controlled player can get when performing the second player press action. The higher the stat is, the closer the pressing player can get. Currently this stat is inactive.	RB/R1
Heading	The heading stat determines a player's accuracy and power when heading the ball. The higher the stat is, the more powerful and accurate a header will be. The power of a header is also affected	Shot: B/O Pass: A, X, Y / X, □, △

	by the incoming speed and angle of the ball.	
--	--	--

Height & Weight

Height: Affects the total jumping reach together with the jumping stat.

For Agility, there is a height multiplier ranging from 0,9-1 acting on top of the stat. This means that a player of maximum height will have their agility stat multiplied by 0,9, and a player of minimum height will have their agility stat multiplied by 1. This means that the average agility of tall players will be slightly lower than for short players. The reasoning behind this multiplier is to balance the advantages between short and tall players since tall players inevitably will have an advantage for headers due to a better total jumping reach on average.

Weight: When determining the weight of a player upon generation, the height and the strength stat are the determining factors. The taller the player is, and the stronger the player is, the heavier they will be. Weight is being used to determine how much force a player can exert and withstand during collisions and duels.

Goalkeeper Attributes

Goalkeepers will have their own separate cards and different attributes. These are the six main attributes for goalkeepers:

Diving (DIV)

Attribute	Description	Controls
Diving	How much reach a GK can get when diving, both horizontally and	AI Controlled Reflexes

	vertically. A taller GK will have some extra range on top	
--	---	--

Handling (HAN)

Attribute	Description	Controls
Catching	How well a GK can catch and hold onto an incoming shot. The higher the stat the more likely the GK is to catching the ball rather than parrying it	AI Controlled
Parrying	The higher the parrying stat is the more likely the goalkeeper is to deflect the ball away from the danger zones when making a save.	AI Controlled

Distribution (DIS)

Attribute	Description	Controls
Kicking Power	How much power a GK can generate behind their kicks	Shoot/Lofted Pass Button
Ground Pass	Same as for outfield players	Short Pass: Pass Button Driven Pass: R1 + Pass Button
Lofted Pass	Same as for outfield players	Lofted Pass Button

Through Balls	Same as for outfield players	Through Ball Button for Ground, L1+ Through Ball for Lofted
Weak Foot	Same as for outfield players	AI Controlled
Throwing	How accurately and far a GK can throw the ball	AI Controlled

Reflexes (REF)

Attribute	Description	Controls
Reflexes	How quick a GK can react to an incoming shot.	AI Controlled

Awareness (AWA)

Attribute	Description	Controls
Positioning	How well a GK is able to position themselves. The lower the stat the more likely the GK will be to deviate from the ideal position	AI Controlled
Command of Area	How well a GK is at coming out and dealing with incoming crosses. This stat is not active yet.	AI Controlled
Rushing	The rushing stat affects how well the keeper can determine when they should come off the line to collect a	AI Controlled

	loose ball. The stat hasn't been activated yet.	
Penalty Saving	Affects the size of the saving zone and the ability to catch a ball when saving a penalty.	AI Controlled

Athleticism (ATH)

Attribute	Description	Controls
Acceleration	Same as for outfield players	When user controlled- Sprint Button When forced to come out by user- Triangle Button When GK comes out on their own- AI Controlled
Speed	Same as for outfield players	When user controlled- Sprint Button When forced to come out by user- Triangle Button When GK comes out on their own- AI Controlled
Strength	Same as for outfield players	AI Controlled User Controlled: L2 + Shield
Jumping	How high a GK can jump from the ground to catch incoming	AI Controlled

	crosses or lofted passes.	
--	------------------------------	--
